

## **Chapter 2.1.13 – Classical Swine Fever (CSF)**

### **General Comment:**

The United States assumes that the proposed text “unless there are validated means of distinguishing between vaccinated and infected pigs”, which appears in multiple places in the Chapter, was inserted because there is a differential test or vaccine that is close to being validated. If so, the United States requests that the scientific citation for determining differential test validity be referenced or included in the Chapter as a footnote or a relevant appendix. If the tests and/or vaccines have not been licensed and validated, then it would be too pre-mature to propose such language in the Code Chapter, and the United States could not support this change.
